Abstract

Proposed is a method and a system for work time recording in which a data recording client (10,...,16) records biometric data and/or data on physical condition of the user (1), and transmits it together with the user data over a first
5   communication channel (30/31) to the central unit (20/21). The user (1) is identified based on the transmitted biometric data and/or data on physical condition and biometric data and/or data on physical condition of users stored in the user database (40). The analyzed data are transmitted to a remuneration recording module (50), and are evaluated and/or checked by means of the
10 remuneration recording module (50).

List of Reference Numerals

1		user
2		mobile unit
10,...,16		data recording client
	101	input unit
	102	input elements
20/21		central unit
30/31		first communication channel
32		second communication channel
40		user database
50		remuneration recording module
